

OpenLB technical report: Compiling OpenLB with Linux Bash for Windows

Jesse Ross-Jones

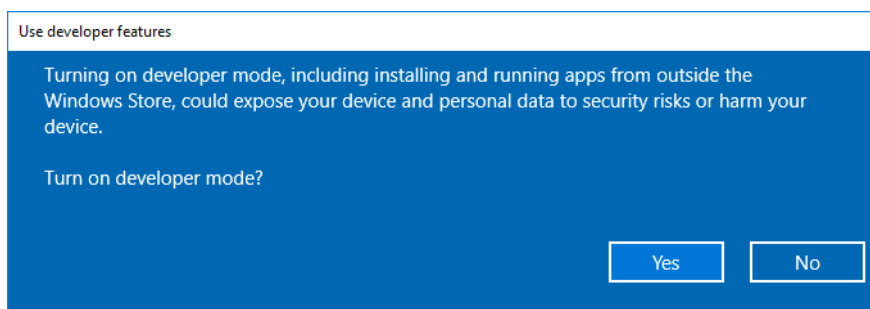

April 2017

The here described installation procedure has been tested with OpenLB 1.1 and Windows 10 x64.

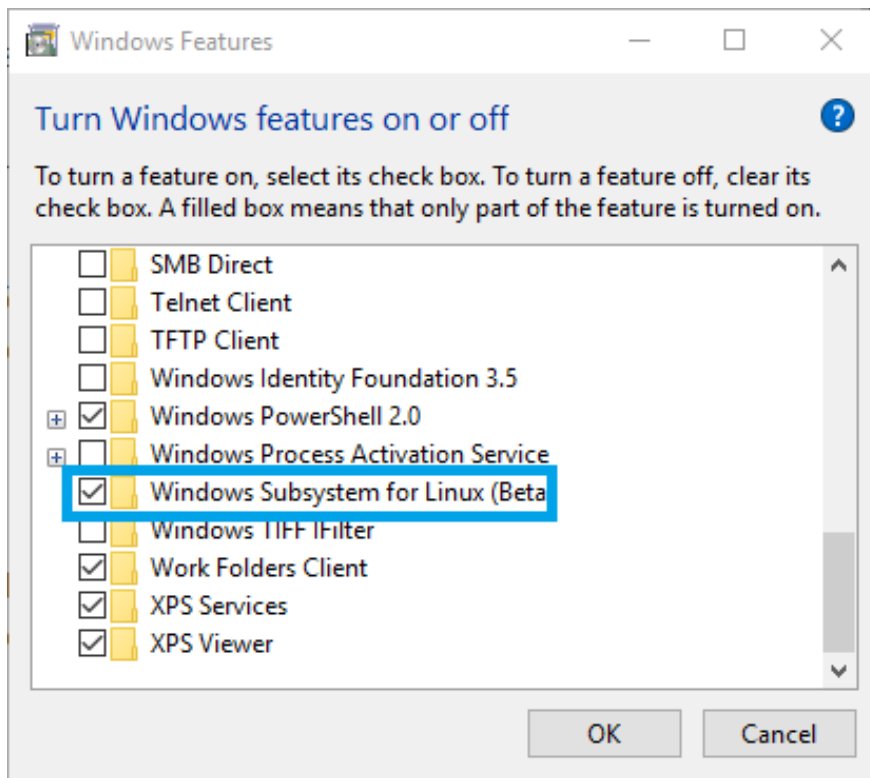

1. Make sure you are using a 64-bit version of Windows 10 with the Anniversary Update
2. Open the Settings app and go to **Update & Security - For Developers**. Activate the **Developer Mode** switch here to enable Developer Mode.

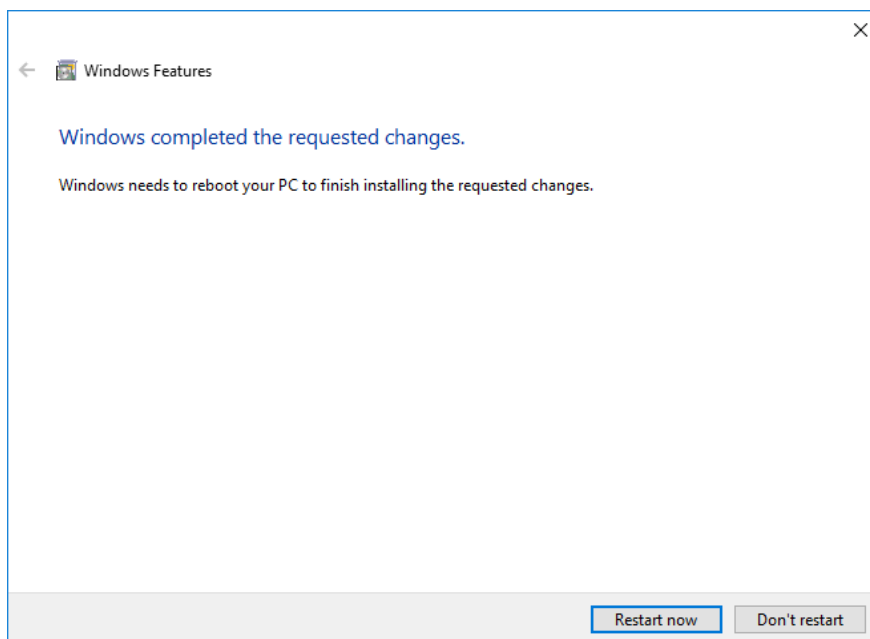

3. Enable installation of apps outside the Windows Store

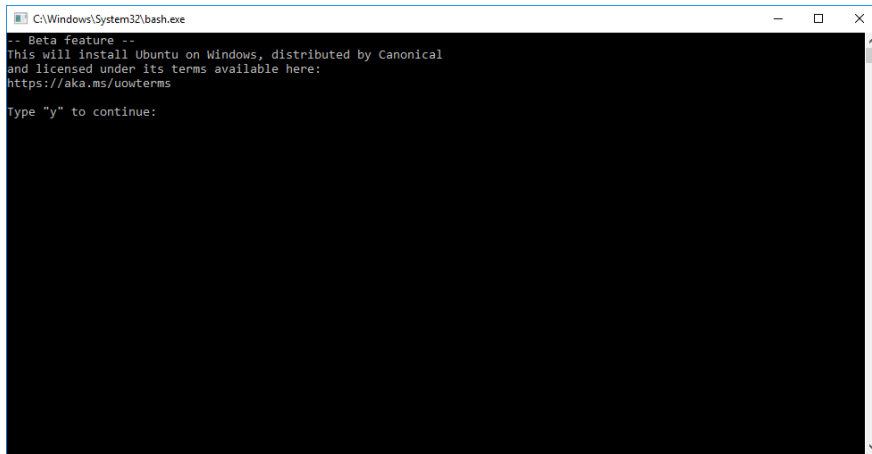

4. Open the Control Panel, click **Programs** and select **Turn Windows Features On or Off** under Programs and Features. Enable the **Windows Subsystem for Linux (Beta)** option in the list here and click **OK**.

5. Reboot

6. After the computer restarts click the Start button and type **"bash"**

```
C:\Windows\System32\bash.exe
-- Beta feature --
This will install Ubuntu on Windows, distributed by Canonical
and licensed under its terms available here:
https://aka.ms/uowterms
Type "y" to continue:
```

7. type "y" to accept the license
8. Wait for the Linux image to be downloaded then create a UNIX username and password
9. Before installing the required libraries run:
sudo apt-get update
10. Next, install the g++ compiler, which you will need to compile C++ programs:
sudo apt-get install g++ make
11. To benefit from the efficient parallelization, you will probably want to run the program on more than one core, so it is recommended to install Open-MPI:
sudo apt-get install openmpi-bin openmpi-doc libopenmpi-dev
12. Download OpenLB from <http://www.openlb.net/> and unzip it to a folder (e.g. C:\Users\USERNAME\Documents\openlb).
13. Navigate to this folder within the Linux Bash (e.g. `cd /mnt/c/Users/USERNAME/Documents/openlb`)
14. Finally, go into the root folder of OpenLB and type **make** to compile the software library and all examples. If your system is set up correctly, you should see a lot compiler messages but no errors.
